# Part 1 : PROGRAM INSPECTION

---

- **Github Code Link :**

<https://github.com/JOSMAN-UE/ADB.-SQL-like-DB./blob/main/adb.c>

## 1. Errors Identified in the Program :

### Category A: Data Reference Errors

1. Uninitialized variables (e.g., MABUF)
2. Array boundary issues (e.g., TOKS[MAXWORDS][IDSZX])
3. Pointer memory management (e.g., invalid qq in hexdmp())
4. Uninitialized variables (e.g., DBDIN, RECUNI)
5. Array boundary issues (e.g., TADIN[], RECUNI[] without bounds checking)
6. Invalid file handle in HDLUopen() if open() fails
7. Pointer dereferencing issues (e.g., p in existfile())
8. Uninitialized variables (e.g., TADIN[tt].SEQ, RECUNI[tt].crc)
9. Array boundary issues (e.g., buf[nw] in setCRC() and evalCRC())
10. Pointer memory management issues (e.g., p in setRECdflt() and printREC())
11. Pointer dereferencing issues with pf in sortfcmp2
12. No array boundary checks for IXDB and IXDIN
13. Potential buffer overflow in printix with IXDB[ii].RBA
14. Pointer dereferencing issues in tabfullscan with memmove and array KPAGE.R[].
15. Lack of bounds checks for arrays VGRP[] and KPAGE.R[], leading to potential undefined behavior.
16. Missing null pointer checks for structures like UOW, which could cause segmentation faults.

## **Category B: Data-Declaration Errors**

1. Missing explicit declarations (e.g., I32)
2. Shadowing issues (e.g., variable buf in todayMABUF())
3. Implicit size assumptions in structures (e.g., TYPTADIN)
4. Undeclared or missing types (e.g., I8, I32)
5. Undefined types (e.g., I16, I32, U16)
6. Inconsistent declaration (e.g., buf in newpage() function)
7. Implicit type conversions leading to incorrect results in sortfcmp2
8. Undefined variables like UOW in indexfull()
9. Implicit type conversion issues between long (e.g., posl) and int (e.g., tt), which could lead to bugs.
10. Incorrect initialization checks for variables like grows, nrmcnt, and delcnt in tabfullscan() across various command cases.

## **Category C: Computation Errors**

1. Mixed-mode arithmetic
2. Division by zero checks not present
3. Mixed-mode arithmetic in functions (e.g., dbstate(), tell())
4. Potential division by zero in computations (e.g., openTAB())
5. Mixed-mode arithmetic issues in setCRC() and evalCRC()
6. No division by zero check for computations based on file lengths
7. Sorting logic issues in sortIXDB, especially with mixed data types
8. Lack of division by zero checks, particularly in modulus calculations
9. Integer overflow risks in the loop for(int i=0; i LT rio; i++) without proper bounds checks.
10. Division by zero potential in the operation stio%LRECU without ensuring LRECU is non-zero.

## **Category D: Comparison Errors**

No Error Found !!!

## **Category E: Control-Flow Errors**

1. Possible infinite loop in `exitenable()`
2. Infinite loop potential in `hdlcheck()`
3. Incorrect return value handling in `dbstate()`
4. Possible infinite loops in `matchSYSDIN()`
5. Unchecked return values in `readREC()`
6. Possible infinite loops in `findkey`
7. Missing default case in `switch(cmd)` in `indexfull()`
8. Missing default case in the `switch(cmd)` block, relying on an `assert` statement for unexpected values.
9. Loop termination issues with `while(NOT stopscan)`, which could lead to infinite loops or performance problems.

## **Category F: Interface Errors**

No Error Found !!!

## **Category G: Input / Output Errors**

No Error Found !!!

## **Category H: Other Checks**

No Error Found !!!

## **2.Effective Category of Program Inspection:**

- Data Reference Errors (Category A)

### **3. Errors Not Easily Identified via Program Inspection:**

- Concurrency Issues: Race conditions in multi-threaded environments.
- Memory Leaks: Difficult to identify without runtime analysis.
- Performance Degradation: Impact on large datasets not visible without profiling.

### **4. Applicability of Program Inspection Techniques:**

- Yes it is Valuable for Memory Safety, Array Bounds Checking, Control Flow Validation. And also Complement with Dynamic testing.

# Part 2 : CODE DEBUGGING

---

## 1. Armstrong Number Program

**Error:** Incorrect computation of the remainder.

**Fix:** Use breakpoints to check the remainder calculation.

- **Corrected Code:**

```
class Armstrong
{
public
    static void main(String args[])
    {
        int num = Integer.parseInt(args[0]);
        int n = num, check = 0, remainder;
        while (num > 0)
        {
            remainder = num % 10;
            check += Math.pow(remainder, 3);
            num /= 10;
        }
        if (check == n)
        {
            System.out.println(n + " is an Armstrong Number");
        }
        else
        {
            System.out.println(n + " is not an Armstrong Number");
        }
    }
}
```

## 2. GCD and LCM Program

### Errors:

1. Incorrect while loop condition in GCD.
2. Incorrect LCM calculation logic.

### Fix:

Breakpoints at the GCD loop and LCM logic.

### • Corrected Code:

```
import java.util.Scanner;
public
class GCD_LCM
{
    static int gcd(int x, int y)
    {
        while (y != 0)
        {
            int temp = y;
            y = x % y;
            x = temp;
        }
        return x;
    }
    static int lcm(int x, int y)
    {
        return (x * y) / gcd(x, y);
    }
public
    static void main(String args[])
    {
        Scanner input = new Scanner(System.in);
        System.out.println("Enter the two numbers: ");
        int x = input.nextInt();
        int y = input.nextInt();

        System.out.println("The GCD of two numbers is: " + gcd(x, y));
        System.out.println("The LCM of two numbers is: " + lcm(x, y));
        input.close();
    }
}
```

### 3. Knapsack Program

**Error:** Incrementing `n` inappropriately in the loop.

**Fix:** Breakpoint to check loop behavior.

- **Corrected Code:**

```
public
class Knapsack
{
public
    static void main(String[] args)
    {
        int N = Integer.parseInt(args[0]);
        int W = Integer.parseInt(args[1]);
        int[] profit = new int[N + 1], weight = new int[N + 1];
        int[][] opt = new int[N + 1][W + 1];
        boolean[][] sol = new boolean[N + 1][W + 1];
        for (int n = 1; n <= N; n++)
        {
            for (int w = 1; w <= W; w++)
            {
                int option1 = opt[n - 1][w];
                int option2 = (weight[n] <= w) ? profit[n] + opt[n - 1][w -
weight[n]] : Integer.MIN_VALUE;
                opt[n][w] = Math.max(option1, option2);
                sol[n][w] = (option2 > option1);
            }
        }
    }
}
```

## 4. Magic Number Program

### Errors:

3. Incorrect condition in the inner while loop.
4. Missing semicolons in expressions.

**Fix:** Set breakpoints at the inner while loop and check variable values.

### • Corrected Code:

```
import java.util.Scanner;

public
class MagicNumberCheck
{
public
    static void main(String args[])
    {
        Scanner ob = new Scanner(System.in);
        System.out.println("Enter the number to be checked.");
        int n = ob.nextInt();
        int sum = 0, num = n;
        while (num > 9)
        {
            sum = num;
            int s = 0;
            while (sum > 0)
            {
                s = s * (sum / 10); // Fixed missing semicolon sum = sum %
10;
            }

            num = s;
        }
        if (num == 1)
        {
            System.out.println(n + " is a Magic Number.");
        }
        else
        {
            System.out.println(n + " is not a Magic Number.");
        }
    }
}
```

## 5. Merge Sort Program

### Errors:

1. Incorrect array splitting logic.
2. Incorrect inputs for the merge method.

**Fix:** Breakpoints at array split and merge operations.

### • Corrected Code:

```
import java.util.Scanner;

public
class MergeSort
{
public
    static void main(String[] args)
    {
        int[] list = {14, 32, 67, 76, 23, 41, 58, 85};
        System.out.println("Before: " + Arrays.toString(list));
        mergeSort(list);
        System.out.println("After: " + Arrays.toString(list));
    }

public
    static void mergeSort(int[] array)
    {
        if (array.length > 1)
        {
            int[] le = leftHalf(array);
            int[] right = rightHalf(array);
            mergeSort(le);
            mergeSort(right);
            merge(array, le, right);
        }
    }

public
    static int[] leftHalf(int[] array)
    {
        int size1 = array.length / 2;
        int[] le = new int[size1];
        System.arraycopy(array, 0, le, 0, size1);
        return le;
    }

public
    static int[] rightHalf(int[] array)
```

```

    {
        int size1 = array.length / 2;
        int size2 = array.length - size1;
        int[] right = new int[size2];
        System.arraycopy(array, size1, right, 0, size2);
        return right;
    }

public
    static void merge(int[] result, int[] le, int[] right)
    {
        int i1 = 0, i2 = 0;
        for (int i = 0; i < result.length; i++)
        {
            if (i2 >= right.length || (i1 < le.length && le[i1] <=
right[i2]))
            {
                result[i] = le[i1];
                i1++;
            }
            else
            {
                result[i] = right[i2];
                i2++;
            }
        }
    }
}

```

## 6. Multiply Matrices Program

### Errors:

1. Incorrect loop indices.
2. Wrong error message.

**Fix:** Set breakpoints to check matrix multiplication and correct messages.

### • Corrected Code:

```
import java.util.Scanner;

class MatrixMultiplication
{
public
    static void main(String args[])
    {
        int m, n, p, q, sum = 0, c, d, k;

        Scanner in = new Scanner(System.in);

        System.out.println("Enter the number of rows and columns of the first matrix");

        m = in.nextInt();
        n = in.nextInt();

        int first[][] = new int[m][n];

        System.out.println("Enter the elements of the first matrix");

        for (c = 0; c < m; c++)
            for (d = 0; d < n; d++)
                first[c][d] = in.nextInt();

        System.out.println("Enter the number of rows and columns of the second matrix");

        p = in.nextInt();
        q = in.nextInt();

        if (n != p)

            System.out.println("Matrices with entered orders can't be multiplied.");
    }
}
```

```

else{

    int second[][] = new int[p][q];

    int multiply[][] = new int[m][q];

    System.out.println("Enter the elements of the second matrix");

    for (c = 0; c < p; c++)

        for (d = 0; d < q; d++)

            second[c][d] = in.nextInt();

    for (c = 0; c < m; c++)

    {

        for (d = 0; d < q; d++)

        {

            for (k = 0; k < p; k++)

            {

                sum += first[c][k] * second[k][d];

            }

            multiply[c][d] = sum;

            sum = 0;

        }

    }

    System.out.println("Product of entered matrices:");

    for (c = 0; c < m; c++) {

        for (d = 0; d < q; d++)

            System.out.print(multiply[c][d] + "\t");

        System.out.print("\n");

    }

}

}
}

```

## 7. Quadratic Probing Hash Table Program

### Errors:

1. Typos in **insert**, **remove**, and **get** methods.
2. Incorrect logic for rehashing.

**Fix:** Set breakpoints and step through logic for insert, remove, and get methods.

### • Corrected Code:

```
import java.util.Scanner;

class QuadraticProbingHashTable
{
    private
        int currentSize, maxSize;
    private
        String[] keys, vals;
    public
        QuadraticProbingHashTable(int capacity)
        {
            currentSize = 0;
            maxSize = capacity;
            keys = new String[maxSize];
            vals = new String[maxSize];
        }
    public
        void insert(String key, String val)
        {
            int tmp = hash(key), i = tmp, h = 1;
            do
```

```

{

    if (keys[i] == null)

    {

        keys[i] = key;

        vals[i] = val;

        currentSize++;

        return;

    }

    if (keys[i].equals(key))

    {

        vals[i] = val;

        return;

    }

    i += (h * h++) % maxSize;

} while (i != tmp);

}

```

public

```

String get(String key)

{

    int i = hash(key), h = 1;

    while (keys[i] != null)

    {

        if (keys[i].equals(key))

            return vals[i];

    }

}

```

```
        i = (i + h * h++) % maxSize;

    }

    return null;

}
```

public

```
    void remove(String key)

    {

        if (!contains(key))

            return;

        int i = hash(key), h = 1;

        while (!key.equals(keys[i]))

            i = (i + h * h++) % maxSize;

        keys[i] = vals[i] = null;

    }
```

private

```
    boolean contains(String key)

    {

        return get(key) != null;

    }
```

private

```
    int hash(String key)

    {
```

```
        return key.hashCode() % maxSize;

    }

}

public class HashTableTest
{
    public

        static void main(String[] args)

        {

            Scanner scan = new Scanner(System.in);

            QuadraticProbingHashTable hashTable = new
QuadraticProbingHashTable(scan.nextInt());

            hashTable.insert("key1", "value1");

            System.out.println("Value: " + hashTable.get("key1"));

        }

}
```

## 8. Sorting Array Program

### Errors:

1. Incorrect class name with an extra space.
2. Incorrect loop condition and extra semicolon.

**Fix:** Set breakpoints to check the loop and class name.

### • Corrected Code:

```
import java.util.Scanner;
public
class AscendingOrder
{
public
    static void main(String[] args)
    {
        int n, temp;
        Scanner s = new Scanner(System.in);
        System.out.print("Enter the number of elements: ");
        n = s.nextInt();
        int[] a = new int[n];
        System.out.println("Enter all the elements:");
        for (int i = 0; i < n; i++)
            a[i] = s.nextInt();
        for (int i = 0; i < n; i++)
        {
            for (int j = i + 1; j < n; j++)
            {
                if (a[i] > a[j])
                {
                    temp = a[i];
                    a[i] = a[j];
                    a[j] = temp;
                }
            }
        }

        System.out.println("Sorted Array: " + Arrays.toString(a));
    }
}
```

## 9. Stack Implementation Program

### Errors:

1. Incorrect `top--` instead of `top++` in `push`.
2. Incorrect loop condition in `display`.
3. Missing `pop` method.

**Fix:** Add breakpoints to check `push`, `pop`, and `display` methods.

### • Corrected Code:

```
public
class StackMethods
{
private
    int top;
private
    int[] stack;

public
    StackMethods(int size)
    {
        stack = new int[size];
        top = -1;
    }

public
    void push(int value)
    {
        if (top == stack.length - 1)
        {
            System.out.println("Stack full");
        }
        else
        {
            stack[++top] = value;
        }
    }

public
    void pop()
    {
        if (top == -1)
        {
            System.out.println("Stack empty");
        }
    }
}
```

```
    }  
    else  
    {  
        top--;  
    }  
}  
  
public  
    void display()  
    {  
        for (int i = 0; i <= top; i++)  
        {  
            System.out.print(stack[i] + " ");  
        }  
        System.out.println();  
    }  
}
```

## 10. Tower of Hanoi Program

**Error:** Incorrect increment/decrement in recursive call.

**Fix:** Breakpoints at the recursive calls to verify logic.

- **Corrected Code:**

```
public
class TowerOfHanoi
{
public
    static void main(String[] args)
    {
        int nDisks = 3;
        doTowers(nDisks, 'A', 'B', 'C');
    }

public
    static void doTowers(int topN, char from, char inter, char to)
    {
        if (topN == 1){
            System.out.println("Disk 1 from " + from + " to " + to);
        }
        else{
            doTowers(topN - 1, from, to, inter);
            System.out.println("Disk " + topN + " from " + from + " to " +
to);
            doTowers(topN - 1, inter, from, to);
        }
    }
}
```
